# NutraBurst™

## Boron 7%

PCT | Sunrise NutraBurst™ Boron 7% is important for strong cell walls, disease resistance, stem branching, nodulations in legumes, flower development and pollination. Boron 7% is essential in providing sugars to plant roots and therefore is necessary in the soil. It is generally a soluble nutrient but is usually only available to the plant from a soil application when adequate supply and water is available to the plant. Boron 7% can provide consistent growth under adverse soil conditions. It is not easily transported within the plant. Boron 7% is needed for pollen tube development as well as seed and fruit development. Legume crops generally require higher amounts of Boron 7% for nodulations. A general leaf test range for Boron 7% needs to be between 20 -100 ppm.

PCT | Sunrise NutraBurst™ Boron 7% can be applied in a 2x2 soil application but is not recommended in an on-seed starter or for in-furrow use. Applications use rate should be increased when foliar applied and be based on need with the use of a plant tissue test to confirm final foliar rate.

Use rates:

Soil application: 2-16 oz/acre  
(apply only in 2x2 or away from seed)

Foliar application: 16-32 oz/acre  
(10-15 gallon of a water carrier is recommended for adequate coverage)

*\* Do not apply to foliage if air temperature is to exceed 85 degrees at time of application.*

*Boron deficiency*
